

SuVa x BTQ — Partnership Preparation

March 2026 | Before responding to BTQ or taking a call

What BTQ Said

"Spoke with William last week about SuVa, we're both trending very much in the same direction. Trying to understand if and how we can potentially work together. Can we jump on a call in the next couple of weeks to understand where you guys are at and how we could potentially complement you? And vice versa."

Who BTQ Is

BTQ Technologies Corp is a **publicly traded** (NASDAQ: BTQ, CBOE CA: BTQ) post-quantum cryptography company. They are not a startup. They are founded by post-quantum cryptographers and have real institutional partners.

Their products:

- **QSSN** — Quantum-secure stablecoin network infrastructure for DeFi. **This is the direct overlap with SuVa.**
- **QCIM** — Quantum-secure cryptographic hardware
- **OSS** — One Shot Signatures (novel quantum signature scheme)
- **QPoW** — Quantum-proof blockchain consensus
- **QRiNG** — Quantum random number generation

Their partners: University of Waterloo, ID Quantique, Hon Hai Research, Radical Semiconductor, Macquarie University.

The Honest Reality Before the Call

Before taking this call, be clear-eyed about where SuVa actually is:

What SuVa has	What SuVa does not have
A clear vision and whitepaper	Working code beyond a forked repo
A technical roadmap	Any deployed contracts
A website (suva.tech) with an MVP page	A real MVP
Academic partnership in progress (UCL)	Formal company registration
A contracted developer (Mohammed)	Audited or reviewed code

BTQ has a publicly traded company, institutional partners, hardware products, and years of research. SuVa has a strong vision and early-stage development.

This is not a problem — it just means you need to position correctly. Do not oversell what exists.

Where SuVa and BTQ Overlap

Area	SuVa	BTQ
Post-quantum stablecoins	Core product (qUSDT, qUSDC)	QSSN product
EVM / Ethereum focus	Yes — Solidity, ERC-4337	Unknown — need to clarify
NIST standards (Falcon, SPHINCS+)	Yes — FIPS 204, 205, 206	Yes — post-quantum cryptographers
Hardware	No	Yes — QCIM hardware
Academic validation	UCL (in progress)	U of Waterloo, Macquarie
Target clients	USDT, USDC issuers	DeFi, digital currencies broadly

The key question is whether QSSN and SuVa are the same thing or complementary. If they are building the same product, this is an acquisition or merge conversation. If they are complementary (BTQ does the cryptographic layer, SuVa does the stablecoin integration and go-to-market), this is a partnership.

What SuVa Needs to Know Before the Call

Research these before responding to BTQ:

1. **What exactly is QSSN?** Is it an EVM-based solution or a separate chain? Does it wrap existing stablecoins like SuVa, or is it a new stablecoin entirely?
 2. **Who is SynthIQ?** BTQ mentioned speaking to SynthIQ about SuVa. Who is this person/company and how did they come up?
 3. **What stage is BTQ's QSSN product?** Is it deployed, in testnet, or conceptual like SuVa?
 4. **Why are they reaching out now?** They are a public company. Their interest likely means they see SuVa as an acquisition target, a partner to accelerate their QSSN, or a competitor to monitor.
-

What Partnership Could Actually Look Like

Option 1: BTQ as Cryptographic Infrastructure Partner

SuVa handles the stablecoin wrapper layer (vault contracts, qUSDT/qUSDC, go-to-market with Tether/Circle). BTQ provides the underlying post-quantum cryptographic primitives (their OSS scheme, QCIM hardware for key generation, QRING for randomness). SuVa integrates BTQ's technology rather than building from scratch.

Upside: SuVa gets battle-tested PQ cryptography from a public company with institutional credibility. Faster to market. **Downside:** SuVa becomes dependent on BTQ. Less control over the cryptographic layer.

Option 2: Academic and Standards Collaboration

BTQ has relationships with University of Waterloo and Macquarie. SuVa has UCL. Joint academic work on post-quantum EVM implementations, co-authored papers, shared grant applications.

Upside: Both parties get credibility. No commercial dependency. **Downside:** Slow. Academic timelines are not startup timelines.

Option 3: Commercial Partnership — BTQ Integrates SuVa's Vault Layer

BTQ's QSSN needs a stablecoin wrapping mechanism. SuVa's vault contract (qUSDT, qUSDC) is exactly that. BTQ uses SuVa's protocol layer for their stablecoin product.

Upside: SuVa gets distribution through a public company. Revenue potential. **Downside:** Only viable when SuVa actually has working vault contracts.

Option 4: Acquisition Conversation

BTQ may be interested in acquiring SuVa outright, especially given the early stage. Not necessarily a bad outcome if the price is right.

Advice: Do not raise this yourself. Let them raise it if that is their intent.

What to Do Before Responding to BTQ

In order of priority:

1. **Get Phase 1 of the codebase running** (forge test passing). You need something to show.
 2. **Register SuVa Protocol Ltd** as a UK limited company. You cannot take a serious partnership call as an unregistered entity.
 3. **Research QSSN** — understand their product in detail before the call.
 4. **Prepare a one-page SuVa technical summary** — current status, roadmap, what you are looking for in a partner.
 5. **Decide your ask** — What do you actually want from BTQ? Credibility? Technology? Distribution? Investment? Be clear before the call.
-

How to Respond to BTQ Now

Send this message back to them:

Hi [Name],

Thanks for reaching out and for speaking with SynthIQ about SuVa. Really appreciate the interest.

We are very aligned on the problem and would love to connect. We are in early-stage development on the EVM side with a focus on wrapping USDT and USDC into

quantum-secured assets using Falcon and SPHINCS+. From what I understand of QSSN, there could be real complementarity here.

Happy to jump on a call in the next two weeks. Before we do, it would be great to understand a bit more about where QSSN is today technically so we can make the conversation as productive as possible. Is there any public documentation or a short summary you could share?

Looking forward to connecting.

William SuVa Protocol

Do not share the suva.tech MVP link until there is a working MVP. Do not share the whitepaper unless they ask. Keep the first exchange light.

Longer Term — Getting USDT and USDC as Clients

The ultimate goal is for Tether (USDT) and Circle (USDC) to integrate SuVa's quantum-proof infrastructure.

What they actually need from you before even taking a call:

- A deployed, audited smart contract on a public testnet
- A security audit from a recognised firm (Trail of Bits, NCC Group, OpenZeppelin)
- Regulatory clarity on whether qUSDT constitutes an EMT under MiCA
- A technical paper or academic publication validating the approach

Realistic timeline to a Tether or Circle conversation: 12 to 24 months from now, assuming development moves quickly.

BTQ shortcut: If BTQ already has relationships with stablecoin issuers through their QSSN product, a joint approach with BTQ as co-partner is far faster than approaching Tether or Circle alone as an early-stage protocol.
